make the reaction proceed catalysis is the increase in rate of a chemical reaction due to the presence of a catalyst. a catalyst is not consumed by the reaction it is recycled and reused. catalysts are often found in automobile catalytic converters, it is a disadvantage of catalysts that they are not usually selective in the reaction that they catalyze. that is, a catalyst will often increase the rate of a reaction that is not its intended reaction, and as a result, products that are not the intended products may be formed. this disadvantage is not so significant when the catalyst is used only once, as is the case for catalysts in industrial processes, but it can be a significant disadvantage when a catalyst is used repeatedly, as is the case for automobile catalytic converters. this is because the selective use of a catalyst over many cycles can lead to a decline in its effectiveness, a phenomenon known as deactivation. the deactivation of a catalyst can be caused by a variety of factors, including poisoning, sintering, and leaching. poisoning occurs when impurities in the reactants block the active sites of the catalyst, reducing its effectiveness. sintering occurs when the catalyst particles sinter together, decreasing the surface area available for reaction. leaching occurs when active components of the catalyst leach out of the catalyst support, reducing its concentration and effectiveness. deactivation can be minimized by using a catalyst with a high resistance to deactivation or by recycling the catalyst after use, as is done in industrial processes, or by using a clean fuel with low levels of impurities, as is done in automobile catalytic converters. an important advantage of catalysts is that they can increase the rate of a reaction without being consumed by the reaction. the amount of catalyst required is typically very small, and the catalyst can be recovered and reused after the reaction is complete, making it a cost-effective and environmentally friendly option for industrial processes. however, an advantage of catalysts is that they are not consumed by the reaction it is recycled and reused, which is a disadvantage when using
